

ABSTRACT OF THE DISCLOSURE

The disclosure relates to a system for remote controlling equipment, which allows at least one server and at least one remote piece of equipment to be interconnected according to the MQIsdp protocol. Said system associates at least one of said remote pieces of equipment with radiocommunication means that emit and receive AT-type commands issued by and/or addressed to an external application which is used by said distance piece of equipment. Said radiocommunication means are provided with a set of specific AT commands for exchanging data with at least one server that uses the MQIsdp protocol such that said server/s and said remote piece/s of equipment can be interconnected via said radiocommunication means without the distant pieces of equipment having to know the MQIsdp protocol.
